

RESULTS SECTION

Results section contains all the items found in the Request section of the Query.

- If items are not in the Request Section of a Query then they will not show up in the Results Section.
- The Results Section also contains any computed item. Computed Items are the blue items in the Outliner of the Results Section.

Note: Remember many items in the results section are used only to populate a computed Item. Be very careful in what you delete, you may be removing a column that is used for computation. **If in Doubt, Don't delete!**

Reasons for modifying the results section:

- Adding a Computed Field.
- Adding a Grouping Column
- Adding a Limit
- Sorting the data

Results Section is a great place to add a limit. A limit in the Results Section is on the data that has been downloaded once you hit process. You are limiting the data on your computer and not going to the Financial Data Warehouse. This makes analysis quick and easy. Results is one of the sections you can use Show Values (you can't use it in the Query Section). It is easier to choose an item then to type in the correct information.
